Upgrade Your Network Scanner!

Free scanners are great - up to a point. That point is when your network reaches a critical size, your assets have acquired a critical value or your company, industry (or Uncle Sam) has set new compliance requirements that those freebee tools just can't handle.

beSECURE, the Automated Vulnerability Detection System, is a step up into the corporate vulnerability assessment and management arena, but with the simplicity you used to get with your favorite freeware scanner.

Running multiple network scanning tools is a pain

Everyone has a half dozen network scanners sitting around and if your network is small and you have time to configure and run multiple tools and then compare often contradictory results, great. If you have a somewhat complicated network and need mission critical reporting that is accurate and easy to produce, then now is the time to find out more about beSECURE.

When a network scan is just not enough

The environment our networks live in is getting way too 'interesting'. On top of having many things you want to do, compliance requirements are coming to your network soon (if you aren't already coping with them). You need a single, solid, common sense solution to find and handle the really nasty vulnerabilities when they happen.

A network scanner with PCI compliance included

Got credit card data? Every installed beSECURE system comes with PCI compliance reporting at no extra cost. Beyond Security is a PCI Approved Scanning Vendor and beSECURE is the tool we use to produce compliance reports. So run beSECURE to do your routine scanning, keep a clean network and breeze through PCI compliance requirements.
